MOHAMMED ABDUL RAHEEM

SOC ANALYST

8897801323 | raheemmohd0000@gmail.com | github.com/raheemmohd | Hyderabad, India

CAREER OBJECTIVE

Cybersecurity fresher with hands-on, lab-built experience in SOC operations — alert triage, log analysis, detection engineering and incident escalation. Comfortable working the full path from raw log to confirmed verdict using SIEM correlation, the NIST incident response lifecycle and MITRE ATT&CK mapping. Seeking a Tier 1 SOC Analyst role to apply and grow these skills in a live environment.

TECHNICAL SKILLS

SIEM & Detection: Splunk, IBM QRadar, Elastic (ELK), Sigma detection rules, SPL & KQL query writing

Frameworks: MITRE ATT&CK, NIST Incident Response Lifecycle, Cyber Kill Chain, OWASP Top 10

Threat Intelligence: MISP, VirusTotal, AbuseIPDB, AlienVault OTX, STIX/TAXII, IOC enrichment & correlation

Network & Endpoint: EDR concepts, Suricata/Snort (IDS/IPS), Wireshark, firewalls, TCP/IP, DNS, VPN

Tools & OS: Linux, Windows, Python (scripting), Git, AWS fundamentals

CORE COMPETENCIES

Alert Triage & Severity Scoring • Log & Traffic Analysis • Threat Hunting • Incident Escalation • Detection Rule Tuning • IAM & Zero Trust Concepts

HANDS-ON PROJECTS

SOC Analyst Project — Alert to Resolution *[Splunk, SIEM, MITRE ATT&CK, NIST IR Lifecycle]*

- Mapped an end-to-end SOC workflow covering a detection-engineering pipeline, an asset/confidence-based alert severity scoring model, and a full triage decision flow.
- Documented 2 complete incident case studies with real log evidence: an SSH brute-force attack that escalated to a confirmed admin-account compromise, and a phishing email that led to macro-based PowerShell execution — both mapped to MITRE ATT&CK techniques and the NIST IR lifecycle.
- Built an interactive 5-alert triage simulator to demonstrate the Tier 1 decision process (false-positive vs. escalation) in practice.

IOC Monitoring & Threat Investigation *[Threat Intel, SIEM Correlation, IOC Enrichment]*

- Modeled the full IOC lifecycle (ingestion → enrichment → SIEM correlation → confidence scoring → action) using MISP, VirusTotal and AbuseIPDB.
- Ran 2 investigations from indicator to verdict: correlated a Tor-exit-node IP against firewall logs to confirm active brute-force traffic, and swept endpoints via EDR/DNS logs for a malware hash and its C2 domain, catching a live match the hash search alone missed.
- Applied a source-reliability × corroboration × recency confidence model to decide between an immediate block and a passive watchlist.

EDUCATION

[Degree] — ABV Govt Degree College, 2025
